

WHAT IS CLAIMED IS:

1. A desktop charger for a bar-type portable wireless terminal having an upper body and a lower body coupled to the lower end of the upper body, the lower body being capable of rotating about an axis of rotation extending in the longitudinal direction of the upper body, the desktop charger comprising:

10 a charger housing;
a slot for receiving and holding the terminal, the slot being recessed a determined depth from a front side toward a rear side of the charger housing; and
an opening for providing a rotation space for the lower body of the terminal, the opening extending from a side of the slot in the transverse direction and penetrating the charger housing from the front side to the rear side.

2. The desktop charger according to claim 1, wherein the slot is provided with a resting surface on its bottom for mounting the upper body of the terminal.

3. The desktop charger according to claim 1, further comprising a charging terminal on the slot to supply power for charging the terminal.

20 4. The desktop charger according to claim 1, further comprising a Man Machine Communication (MMC) slot on a lateral side of the charger housing.

25 5. The desktop charger according to claim 2, further comprising a support which is pivotally assembled with the rear side of the charger housing, the resting surface being slanted a predetermined angle relative to a plane when the support has been rotated and opened while supporting the charger housing.

6. The desktop charger according to claim 5, further comprising a power input terminal provided on the rear side of the charger housing, the power input terminal being opened or closed as the support is unfolded or folded.

5 7. The desktop charger according to claim 5, further comprising a multi-connector provided on the rear side of the charger housing, the multi-connector being opened or closed as the support is unfolded or folded.

8. The desktop charger according to claim 1, wherein the opening is
10 surrounded by closing walls.

9. The desktop charger according to claim 1, further comprising an opening extending from an end of the slot to an end of the charger housing to expose an upper end of the upper body of the terminal mounted on the slot.

15 10. A desktop charger for a bar-type portable wireless terminal having an upper body and a lower body coupled to the lower end of the upper body, the lower body being capable of rotating about an axis of rotation extending in the longitudinal direction of the upper body, the desktop charger comprising:

20 a charger housing;
a slot for receiving and holding the terminal, the slot being recessed a determined depth from a front side toward a rear side of the charger housing;

an opening for providing a rotation space for the lower body of the terminal, the opening extending from a side of the slot in the transverse direction and
25 penetrating the charger housing from the front side to the rear side;

a support which is pivotally assembled with the rear side of the charger housing and which can be rotated and opened while supporting the charger housing;

a first slope surface extending from the rear side of the charger housing, the first slope surface facing and being closed by a lower end of the support, when the support is folded; and

5 a second slope surface extending from an upper end of the first slope surface to the rear side of the charger housing, the second slope surface forming a continuous curved surface with a rear surface of the support, when the support is folded.

11. The desktop charger according to claim 10, further comprising a 10 multi-connector provided on the first slope surface for connection with an external device.

12. The desktop charger according to claim 10, further comprising a power input terminal provided on the first slope surface for external power input.

15

13. The desktop charger according to claim 10, further comprising a Man Machine Communication (MMC) slot on a lateral side of the charger housing.

20

14. A desktop charger for a portable wireless terminal, comprising:
a charger housing;
a slot for receiving and holding a stationary body of the terminal, the slot being recessed a determined depth from a front side toward a rear side of the charger housing; and

25 an opening for providing a rotation space for a body rotatably coupled to an end of the stationary body, the opening extending from a side of the slot in the transverse direction and penetrating the charger housing from the front side to the rear side.

15. The desktop charger according to claim 14, wherein the slot is provided with a resting surface on its bottom for mounting the stationary body of the terminal.

5

16. The desktop charger according to claim 15, further comprising a charging terminal on the resting surface to supply power for charging the terminal.

17. The desktop charger according to claim 14, wherein the opening is 10 surrounded by closing walls.

18. The desktop charger according to claim 14, further comprising a support which is pivotally assembled with the rear side of the charger housing, the resting surface being slanted a predetermined angle relative to a plane when the support has 15 been rotated and opened while supporting the charger housing.
